

Installation Instructions

Audio Interface Kit #34109453

The AMI Audio Interface is used to convert unbalanced audio signals from an AMI preamplifier to balanced audio signals which are compatible with TouchTunes amplifiers.

The AMI Audio Interface is used in the Ovation/Ovation 2 and Allegro MX1 conversion kits. However, each kit requires a different configuration of the AMI Audio Interface. The configuration is changed by moving (4) jumpers on the circuit board inside the Interface.

1. To open the Audio Interfaced, remove (1) screw between the RCA Jacks on the side and remove (4) screws on the bottom. Remove the top cover to access the circuit board.
2. Locate the (4) jumpers on the board. Move all four jumpers to either the 1-2 position (for Allegro MX1) or the 2-3 position (for Ovation/Ovation 2). Note: All four jumpers must to be set in the same position.
3. Replace the cover and the screws.

The jumpers are used to change the routing of audio signals from CH3 and CH4 to OUT A and OUT B as shown below.
